Against a global backdrop of problematic adherence to medical treatment, this volume addresses and provides practical solutions to the simple question: “Why don’t patients take treatments that could save their lives?”

The Wiley Handbook of Healthcare Treatment Engagement offers a guide to the theory, research and clinical practice of promoting patient engagement in healthcare treatment at individual, organizational and systems levels. The concept of treatment engagement, as explained within the text, promotes a broader view than the related concept of treatment adherence. Treatment engagement encompasses more readily the lifestyle factors which may impact healthcare outcomes as much as medication-taking, as well as practical, economic and cultural factors which may determine access to treatment. Over a span of 32 chapters, an international panel of expert authors address this far-reaching and fascinating field, describing a broad range of evidence-based approaches which stand to improve clinical services and treatment outcomes, as well as the experience of users of healthcare service and practitioners alike.

This important book:

- Provides a comprehensive summary of practical approaches developed across a wide range of clinical settings, integrating research findings and clinical literature from a variety of disciplines
- Introduces and compliments existing approaches to improve communication in healthcare settings and promote patient choice in planning treatment
- Presents a range of proven clinical solutions that will appeal to those seeking to improve outcomes on a budget

Written for health professionals from all disciplines of clinical practice, as well as service planners and policy makers, *The Wiley Handbook of Healthcare Treatment Engagement* is a comprehensive guide for individual practitioners and organizations alike.

“At a time when digital technology and artificial intelligence are transforming the practice of medicine, this book shows their promises and limitations with remarkable intelligence. It is through the process [of sharing] that trust is generated, which is the condition for real patient engagement.”

—Gérard Reach, MD, FRCPEdin
